

I am developer A please teach me from the beginning what all I have to do

Perfect. I'll give you a **start** → **finish checklist** for **Developer A (Translation + Image Generation)** so you can execute without confusion.

I'll keep it **practical + conceptual** (for viva).

Tool used: Chatgpt

Section incorporated: Asked AI to teach how the structure of the problem statement should and how I should build it

how should I raise conflict, I have merged 1 feature and in the 2nd feature before merging I need to create conflict

Perfect — you are at the **exact right stage** to create the required merge conflict 🎯

Current state:

- ✓ PR 1 merged (e.g., translation) → main is updated
- ✓ PR 2 (image-generation) still open → good

Now we will **intentionally create a conflict** before merging PR 2.

Tool used: Chatgpt

Section incorporated: Asked to tell possible ways of raising conflict and how to resolve them.

after the above we are supposed to continue with part 2 , please tell how this should be done and how this should be split between the 2 members in team, is that the 2 features written by each developer in part A should be used by that developer only to do what is needed in part b

Great — now we move to **Part 2: Dockerization & Swarm** 🚀

I'll explain:

- 1 What you must build
- 2 How to split work between 2 teammates
- 3 Exact implementation steps
- 4 What to demo for marks

Tool used: Chatgpt

Section incorporated: Asked how should the 2nd part of assignment be done, also Dockerfile and docker-stack.yml was AI generated as mentioned in the git commit but each and every line was understood.

I am developer A please teach me from the beginning what all I have to do

Perfect. I'll give you a **start** → **finish checklist** for **Developer A (Translation + Image Generation)** so you can execute without confusion.

I'll keep it **practical + conceptual** (for viva).

```
docker run -p 8001:8001 \
-e STABILITY_API_KEY=API \
multimodal-api:latest
INFO:   Started server process [1]
INFO:   Waiting for application startup.
INFO:   Application startup complete.
INFO:   Uvicorn running on http://0.0.0.0:8000 (Press CTRL+C to quit)
```

Good — your container **started successfully** ✓

But you mapped the **wrong port**.

Your container runs on:

Code

Uvicorn running on http://0.0.0.0:8000

Tool used: Chatgpt

Section incorporated: Asked for terminal commands to build, push docker image and deploy.

Did not disclose the API_KEY

I am developer A please teach me from the beginning what all I have to do

Perfect. I'll give you a **start** → **finish checklist** for **Developer A (Translation + Image Generation)** so you can execute without confusion.

I'll keep it **practical + conceptual** (for viva).

```
ok then for all features it should be added right, where should it be
added to, in services or routes
example: image_gen.py
from fastapi import APIRouter, HTTPException
from fastapi.responses import FileResponse
from app.models.schemas import ImageRequest
from app.services.image_service import generate_image

router = APIRouter()

@router.post("/generate-image")
def generate(req: ImageRequest):
    try:
        image_path = generate_image(req.prompt)
        return FileResponse(image_path, media_type="image/png")
    except Exception as e:
        raise HTTPException(status_code=500, detail=str(e))

where to add it
```

Great question — and this is important for **clean architecture** 🙌

✓ **Where to add** container_id

You should add it in the **route layer**,
NOT in services.

Why?

Tool used: Chatgpt

Section incorporated: In the route of all services, container id also needed to be returned, for translator and ner features it was quite easy and they were return str and list respectively but for image_generation and tts features it was confusing, so asked AI where and how to add.

These are the major changes which are directly implemented from AI, but for some minor changes like syntax for writing services and routes, AI was taken help of alongwith other websites and videos and hence not included. Also a lot of debugging was done using AI tools which are not included as it is permitted to use AI for debugging. Even for those written using AI, each and every line is thoroughly understood.
